DESCRIPTION:

Coronary computed tomographic angiography (CTA, CCTA) is a noninvasive imaging study that uses intravenously administered contrast material and high-resolution, rapid imaging computed tomography (CT) equipment to obtain detailed volumetric images of the coronary blood vessels. This guideline addresses the use of coronary computed tomographic angiography (CTA, CCTA) in the outpatient setting.

Summary and Analysis of Evidence: An UpToDate review on “Clinical use of coronary computed tomographic angiography” (Villines) states that “Coronary computed tomographic angiography (CCTA) is a well-validated and increasingly utilized noninvasive test for the assessment of coronary artery disease (CAD) in appropriately selected patients with suspected acute or chronic coronary syndromes. In addition to detecting CAD, CCTA is an excellent method to exclude angiographically significant coronary stenoses. The principal indications for CCTA include: As an alternative to stress testing as the initial test in patients with chronic (stable) symptoms suggestive of ischemic heart disease who do not have previously established CAD. As an alternative to invasive coronary angiography in patients with nondiagnostic or equivocal stress test results and persistent symptoms in whom a diagnosis of CAD is uncertain. As the initial test in patients without known CAD who present with possible acute coronary syndrome (ACS) when highly sensitive troponin assay testing and the clinical evaluation cannot confidently exclude ACS. CCTA should not be performed in patients with ongoing chest pain who may have ACS since transporting them is unsafe and CT suites are generally not equipped to deal with potentially unstable patients. As an alternative to stress testing or invasive coronary angiography in selected patients without previously known CAD who are diagnosed with non-ST-elevation ACS with clinically low-risk presentation (e.g., absence of heart failure and refractory ischemic symptoms), and in

whom there is a clinician or patient desire to avoid invasive coronary angiography, or when the cause for troponin elevation is uncertain.”

POSITION STATEMENT:

Computed tomographic angiography (CTA/CCTA) **meets the definition of medical necessity** for the following indications:

Evaluation in suspected coronary artery disease (CAD)

- An alternative to coronary angiography before valve surgery or transcatheter intervention
- Equivocal, borderline, or discordant stress imaging evaluation with continued symptoms concerning CAD
- Evaluation of coronary anomaly or aneurysm
- Evaluation of coronary artery bypass grafts
- Exercise ECG stress test with intermediate Duke Treadmill Score (- 10 to + 4) in whom stress echo cannot be performed
- High pretest probability as an alternative to coronary angiography
- Members with intermediate pretest probability of CAD in whom either exercise electrocardiogram (ECG) stress or stress echocardiogram cannot be performed
- Newly diagnosed clinical systolic heart failure (ejection fraction [EF] < 50%) without recent CAD evaluation in the presence of angina or an anginal equivalent
- Reduced ejection fraction (EF) (EF <40%) as an alternative to invasive coronary arteriography
- Repeat testing in member with new or worse symptoms since prior normal stress imaging.

Additional Information:

Stable individuals without known CAD fall into 2 categories (asymptomatic and symptomatic):

- Asymptomatic, for whom global risk of CAD events can be determined from coronary risk factors, using online cardiac risk calculator (see Reimbursement Information section).
- Symptomatic, for whom we estimate the pretest probability that their chest-related symptoms are due to clinically significant (> 50%) CAD.

Three Types of Chest Pain or Discomfort

- **Typical Angina (definite):** Defined as including all of the following characteristics:
 - Substernal chest pain or discomfort with characteristic quality and duration
 - Provoked by exertion or emotional stress
 - Relieved by rest and/or nitroglycerin.
- **Atypical angina (probable):** Chest pain or discomfort that lacks one of the characteristics of typical angina (definite).

- **Non-anginal Chest Pain:** Chest pain or discomfort that meets one or none of the typical angina (definite) characteristics.

Note: Once the type of chest pain has been established from the medical record, the pretest probability of CAD (meaning obstructive CAD defined as coronary arterial narrowing $\geq 50\%$) is estimated from the below table (Table 1) (Diamond and Forrester Pre-Test Probability of Coronary Artery Disease by Age, Sex (gender) and Symptoms). Additional coronary risk factors could increase pretest probability.

Determination of Pretest Probability for Coronary Artery Disease (CAD)

Table 1: Determination of Pretest Probability for Coronary Artery Disease Based on Age, Sex, and Symptoms (Source: American College of Cardiology Criteria for Pretest Probability of Coronary Artery Disease (CAD)).

The following risk assessment may be used to determine pre-test probability of coronary artery disease:

Age (years)	Sex	Typical/Definite Angina Pectoris	Atypical/Probable Angina Pectoris	Non-anginal Chest Pain	Asymptomatic
≤ 39	Men	Intermediate	Intermediate	Low	Very low
	Women	Intermediate	Very low	Very low	Very low
40 – 49	Men	High	Intermediate	Intermediate	Low
	Women	Intermediate	Low	Very low	Very low
50 – 59	Men	High	Intermediate	Intermediate	Low
	Women	Intermediate	Intermediate	Low	Very low
≥ 60	Men	High	Intermediate	Intermediate	Low
	Women	High	Intermediate	Intermediate	Low

Very low: Less than 5% pretest probability of CAD
 Low: Between 5% and 10% pretest probability of CAD
 Intermediate: Between 10% and 90% pretest probability of CAD
 High: Greater than 90% pretest probability of CAD

Global Risk of Cardiovascular Disease (coronary disease (CAD))

Global risk of CAD is defined as the probability of manifesting cardiovascular disease over the next 10 years and refers to asymptomatic members without known cardiovascular disease. It should be determined using one of the cardiac risk calculators below. A high risk is considered greater than 20% risk of a cardiovascular event over the ensuing 10 years. High global risk by itself generally lacks scientific support as an indication for stress imaging. There are rare exemptions, such as members requiring IC antiarrhythmic drugs, who might require coronary risk stratification prior to initiation of the drug, when global risk is moderate or high.

CAD Risk—Low: 10-year absolute coronary or cardiovascular risk less than 10%.

CAD Risk—Moderate: 10-year absolute coronary or cardiovascular risk between 10% and 20%.

CAD Risk—High: 10-year absolute coronary or cardiovascular risk of greater than 20%.

Duke Treadmill Score

- The equation for calculating the Duke treadmill score (DTS) is, $DTS = \text{exercise time in minutes} - (5 \times \text{ST deviation in mm or } 0.1 \text{ mV increments}) - (4 \times \text{exercise angina score})$, with angina score being 0 = none, 1 = non limiting, and 2 = exercise-limiting.
- The score typically ranges from -25 to +15. These values correspond to low-risk (with a score of $\geq +5$), intermediate risk (with scores ranging from - 10 to + 4), and high-risk (with a score of ≤ -11) categories.

BILLING/CODING INFORMATION:

CPT Coding:

75574	Computed tomographic angiography, heart, coronary arteries and bypass grafts (when present), with contrast material, including 3D image postprocessing (including evaluation of cardiac structure and morphology, assessment of cardiac function, and evaluation of venous structures, if performed)
-------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

REIMBURSEMENT INFORMATION:

LOINC Codes:

The following information may be required documentation to support medical necessity: physician history and physical, physician progress notes, plan of treatment, laboratory studies and reason for computed tomographic angiography (CTA).

Documentation Table	LOINC Codes	LOINC Time Frame Modifier Code	LOINC Time Frame Modifier Codes Narrative
Physician history and physical	28626-0	18805-2	Include all data of the selected type that represents observations made six months or fewer before starting date of service for the claim
Attending physician progress note	18741-9	18805-2	Include all data of the selected type that represents observations made six months or fewer before starting date of service for the claim
Plan of treatment	18776-5	18805-2	Include all data of the selected type that represents observations made six months or fewer before starting date of service for the claim

PROGRAM EXCEPTIONS:

Federal Employee Plan (FEP): Follow FEP guidelines.

Medicare Advantage products: The following Local Coverage Determination (LCD) Computed Tomography (220.1) is located at fcso.com. No National Coverage Determination (NCD) was found at the time of the last guideline reviewed date.

DEFINITIONS:

No guideline specific definitions apply.

RELATED GUIDELINES:

[Computed Tomography to Detect Coronary Artery Calcification, 04-70450-02](#)

OTHER:

Other names used to report computed tomographic angiography (CTA) for coronary artery evaluation:

Cardiac Computed Tomography (CCT) (or CT Angiography)

Coronary angiography (CCTA)

Multi-detector row computed (computerized) tomography (MDCT)

Multi-slice spiral computed (computerized) tomography (MSCT)

COMMITTEE APPROVAL:

This Medical Coverage Guideline (MCG) was approved by the Florida Blue Medical Policy and Coverage Committee on 05/23/24.

GUIDELINE UPDATE INFORMATION:

12/15/04	New Medical Coverage Guideline.
02/15/06	Revised investigational rationales deleted “a lack of” and change to “insufficient evidence”. Added screening for coronary artery disease (CAD) to when services are not covered. Added the word “evaluation” to coronary artery bypass graft patency and coronary artery aneurysm (when services are not covered). Added the wording “delineation of” to congenital coronary artery anomaly (when services are not covered). Added delineation of coronary artery anatomy to when services are not covered. Added CPT “T” codes: 0146T, 0147T, 0148T, and 0149T (tag investigational-MPF), and updated references. Revised name of MCG, deleted “for coronary artery evaluation” – Computed Tomographic Angiography (CTA).
04/01/06	HCPCS update, deleted S8093.
05/15/06	Added 0145T, 0150T, and 0151T.
03/15/07	Scheduled review. Added “for Coronary Artery Evaluation” to the title of the MCG. Revised the descriptor section, to update the information regarding computed tomographic angiography (CTA) and multidetector row helical CT (MDCT) and multislice CT (MSCT). Revised WHEN SERVICES ARE COVERED, added coverage statement for evaluation for evaluation of anomalous coronary arteries. Revised WHEN SERVICES ARE NOT COVERED, added investigational statement for all other indications. Deleted CPT code: 0145T, 0150T, and 0151T from the BILLING/CODING INFORMATION section. Added program exception for Medicare Advantage products. Added cardiac computed tomography (CCT) to OTHER section, and updated references.
06/15/07	Reformatted guideline.
07/01/07	Updated Program Exception section.
01/01/08	HCPCS update. Revised 0146T, 0147T, 0148T, and 0149T descriptor.
01/21/08	Updated Program Exceptions.
03/15/08	Scheduled review. Revised position statement. Updated billing/coding information section, added ICD-9 diagnosis coronary artery anomaly 746.85. Updated reimbursement information section, and updated references.
11/05/08	Updated Program Exceptions.
05/21/09	Removed Federal Employee Plan (FEP) from Florida Blue Radiology Management program exception statement. Added FEP program exception statement: FEP is excluded from the National Imaging Associates (NIA) review; follow FEP guidelines.
06/25/09	Updated Florida Blue Radiology Management program exception; added BlueSelect.

01/01/10	Annual HCPCS coding update: deleted 0146T, 0147T, 0148T, 0149T, and 0151T; added 75572, 75573, and 75574. Revised Florida Blue Radiology Management program exception section, and updated the references.
05/15/10	Updated guideline name, deleted "for coronary artery evaluation". Revised description. Expanded medical necessity indications; added criteria, and updated references.
06/15/11	Annual review: maintain position statements. Updated references.
10/01/11	Revision; formatting changes.
06/15/12	Scheduled review; added indications for computed tomography, heart. Deleted ICD-9 codes (Medicare). Updated references.
12/15/12	Updated Medicare program exception. Added Computed Tomography to Detect Coronary Artery Calcification, 04-70450-02 to related guidelines section.
01/01/14	Review/revision. Added "of the heart and coronary arteries" to computed tomographic angiography (CTA).
05/15/18	Revision; revised position statement. Updated references.
11/15/19	Revised description and position statements; added evaluation in suspected coronary artery disease (CAD). Updated references.
03/15/20	Review/revision. Revised position statement: for exercise electrocardiogram, deleted usually typical or atypical angina; for evaluation of coronary artery bypass grafts revise and expanded criteria. Added definition of coronary artery disease and global risk of cardiovascular disease. Reformatted reimbursement information; moved information (anginal equivalent, Duke treadmill score, online cardiac risk calculator and assessment tools) to position statement. Updated references.
05/15/22	Review/update. Revised and expanded criteria. Updated description, program exception and references.
07/01/22	Revision to Program Exceptions section.
09/30/23	Review: position statements and references updated.
06/15/24	Review; no change in position statement. Updated references.
